Fig. 7. Non-linear regression of the consecutive contractile responses obtained from cumulative concentration-response curves for clonidine in the absence (matched control) or presence of prazosin and idazoxan. The panels show the effects of prazosin or idazoxan in the first (A and B) or second curves (C and D) for clonidine. Each point was expressed as a percentage of the maximum contractile response induced by KCl 80 mM (% KCl contraction). Values are means \pm S.E.M. of 5–10 independent experiments performed with tissues from different rats. * $P < 0.05$ in relation to the E_{max} of the matched control (in absence of antagonists).
